Vickers by Danfoss® Series TV Tie Rod Cylinders

ISO 6020-2 and DIN 24554 Interchangeable
Nominal Pressure: 160 bar Hydraulic Working
Pressure: Up to 210 bar Hydraulic

Danfoss

Features

Global Design:

Engineered for ISO 6020-2/DIN 24554 interchangeability with the durability required for heavy-duty applications.

Rod Cartridge Assembly:

Quick Change design requires no other cylinder disassembly for rod seal maintenance.

SureSeal™ Sealing System:

Carefully selected wiper and seal combinations are mated with a hard chrome plated piston rod to deliver exceptional all-around performance and durability.

Special Wearbands:

Metal-to-metal contact is eliminated, providing superior wearability, increased load carrying capability, and prolonged cylinder life.

Piston Sealing System:

This system offers not only a selection of highly efficient seal materials, but also an extra wide wearband that rides smoothly within the precision-honed cylinder body to provide extended piston seal life.

Square Head Tie-Rod Design:

Suitable for nominal pressure to 160 bar and working pressure up to 210 bar.

Full Range of Ports:

Including SAE, ISO 228-1 BSPP, and metric to ISO 6149 and DIN standard 3852 to provide the broadest piping flexibility.

Piston Rod:

Case hardened, hard chrome plated piston rod in a variety of diameters between 12 and 140 millimeters provides maximum durability and extends seal life. Several different rod end types are available.

ISO Standard Seal Grooves:

Rod and piston sealing systems both conform to ISO standard groove specifications.

Captive Screws:

Inadvertent removal of cushion screws and optional air bleed screws is prevented, while still allowing a full range of adjustment.

Bore Size Range:

Cylinder bores available between 25 and 200 millimeters.

Fully Adjustable

Cushioning System:

This design has been engineered to provide the ability to tune the cushion performance for an optimized deceleration profile. Our patented floating ring cushion seal or an alternate ball check design allows maximum acceleration. This excellent acceleration profile translates into faster cycle times and increased production.

Attention to Details:

One example is the careful design of the body-to-head joint. The design assures ease of assembly while maintaining tight tolerances for exceptional concentricity between cylinder parts.

How To Order

Standard Cylinders

Danfoss has created an easy system for ordering Series TV Cylinders. This system has been developed to improve our service to you. The model code consists of sixteen alpha-numeric digits which fully describe the most common standard options offered on Series TV cylinders.

To specify your Series TV cylinder, review the following pages for a full description of each option available and select the desired code.

This model code system will:

- **Simplify the re-order process.**
Each Series TV cylinder is assigned a sixteen digit model code. That code is unique to a particular cylinder description. That way, when you re-order your Series TV cylinder, you're assured of exactly the same top quality cylinder design.
- **Improve identification.**
Every Series TV cylinder has its sixteen digit model code clearly marked on the product, impression stamped in the metal head or cap. Each sixteen digit code completely describes a specific cylinder. This allows seals and replacement components to be easily identified in the field.
- **Facilitate communications.**
This fully descriptive model code system allows you to work directly with your local Danfoss sales engineer to identify and service your Vickers by Danfoss cylinder.

NOTE

See pages 4 and 5 for a summary of ISO 6020-2 model code options. See page 6 for a summary of DIN 24554 model code options.

Custom Cylinders

New Cylinders

Although the model code has been arranged to cover the vast majority of available options, there will be occasions when you require an option which cannot be coded. When specifying such an option, enter an "X" for the appropriate item in the sixteen digit model code, then describe your requirements. For example, if you have an application which requires a custom thread on the end of the piston rod, enter an "X" for item 7. Then add a full description at the end of the model code, such as "With 80mm total rod projection and M22 x 1,5 thread 35mm long." The cylinder will then be given a unique five digit design number on receipt of order (as explained below).

If more than one of the available options represented in items 15 and 16 are required, add the appropriate codes as a suffix. The cylinder will then be given a unique five digit design number on receipt of your order (as explained below).

Replacement Cylinders

Every Vickers by Danfoss custom cylinder is assigned a unique design number. This number is contained in the last five digits of the sixteen digit model code, and item 12 is always an alpha character. In other words, the "Stroke" and "Extra Rod Projection" locations (items 12 through 16) become the "Design Number" items for custom cylinders. When ordering a replacement cylinder, simply give the sixteen digit model code or the five digit design number to your local Vickers by Danfoss Sales Representative.

Replacement Parts

Each design number is stored in a quick retrieval computerized storage system. This gives our field sales representatives rapid access to assist you in identifying and specifying genuine Vickers by Danfoss replacement parts.

Model Codes for ISO 6020-2 Series TV Cylinders*

(All dimensions are in millimeters)

10 Port location

Ports are located as shown below when viewing cylinder from head end (mounting end of double rod cylinder).

With some mounting styles, certain port locations cannot be selected due to interference with the mounting.

Code	Head	Cap
K –	1	1
L –	1	2
M –	1	3
N –	1	4
P –	2	1
R –	2	2
S –	2	3
T –	2	4
U –	3	1
V –	3	2
W –	3	3
Y –	3	4
1 –	4	1
2 –	4	2
3 –	4	3
4 –	4	4

(See detailed information on page NO TAG.)

11 Cushion location

Cushions are located as shown in item 10 when viewing cylinder from head end (mounting end of double rod cylinder). “–” in table indicates no cushion.

Code	Head	Cap
A –	–	–
B –	–	1
C –	–	2
D –	–	3
E –	–	4
F –	1	–
G –	2	–

Y –	3	4
1 –	4	1
2 –	4	2
3 –	4	3
4 –	4	4

12, 13, 14 Stroke length

Stroke length can be from 001 mm to 999 mm.

15, 16 Enter applicable code for either:**Extra rod projection (“C” dimension)**

This number is the extra rod projection from 00 mm through 99 mm.

– or –

Air bleed, gland drain or proximity switch location

Position 15 indicates air bleeds (H), gland drain (G) or proximity switches (P).

Position 16 indicates location of air bleeds, gland drain, or proximity switches as shown in item 10 when viewing cylinder from head end (mounting end of double rod cylinder). “–” in table indicates no air bleed or proximity switch.

Code	Head	Cap
B –	–	1
C –	–	2
D –	–	3
E –	–	4
F* –	1	–
G* –	2	–
H* –	3	–
J* –	4	–
K –	1	1
L –	1	2
M –	1	3
N –	1	4
P –	2	1
R –	2	2
S –	2	3
T –	2	4
U –	3	1
V –	3	2
W –	3	3
Y –	3	4
1 –	4	1
2 –	4	2
3 –	4	3
4 –	4	4

(See detailed information on page NO TAG.)

* Only these position codes should be used for the (G) gland drain option.

HR –	2	2
HW –	3	3
H4 –	4	4

* See pages 4 and 5 for ISO 6020-2 cylinder model codes.

Mounting Style

Available Mountings

The variety of standard ISO and DIN mountings available in the Series TV gives you a broad selection to match the proper mount to your application. Vickers by Danfoss offers rigid mounts (including side lug, flange, and extended tie rod) and swivel mounts (including clevis and trunnion). The mounting styles that conform to DIN 24554 are shown on this page. Other ISO 6020-2 compatible mounts are shown on the next page. A guide to proper mount selection is provided on pages NO TAG through NO TAG. For custom mounts, enter "XX" for model code items 3 and 4 and give a detailed description with drawings. Series TV cylinders are available in all mounting styles listed.

Selecting the Proper Mounting

Just as the cylinder bore must be sized to provide the proper force for an application, a cylinder mounting that can absorb these application forces must also be specified. All Series TV mounts are designed to absorb the full rated force of the cylinder when properly applied. Note that the TV01 has been downrated to 70 bar and the TV04 and TV25 are downrated to 100 bar to minimize deflection on these non-centerline mounts. For applications where the motion is linear and parallel to the cylinder rod motion, a rigid mount is recommended. For curvilinear motion, a swivel mount should be chosen. The specifics of each application dictate the correct mounting style.

Series TV Mounting Styles & Installation Dimensions

TV01 Side Lug Mounts

Side lug mounts are for moving loads along a flat guided surface as in a carriage along rails.

The mounting surface should be flat and parallel to the centerline of the piston rod. The load should be guided to

traverse along the centerline of the piston rod.

The frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.

NOTE

Limit operating pressure to 70 bar for minimum deflection. For strokes in excess of 600mm, see "Stop tube selection" on page NO TAG.

With unsupported loads, the bearing must absorb more force. For these applications, the larger available rod is recommended, and stop tubes should be considered.

Use high tensile socket head cap screws or hex head bolts tightened to the manufacturer's recommended torque.

For high shock applications, dowel pins or shear keys should be incorporated in the mounting design. For these applications, consider a keyed side lug mount, TV04.

For severe side load applications, consult your local Vickers by Danfoss sales engineer.

TV04 Keyed Side Lug Mounts

Keyed side lug mounts are for moving loads along a flat guided surface as in a carriage along rails.

The mounting surface should be flat and parallel to the centerline of the piston rod. The load should be guided to traverse along the centerline of the piston rod.

The frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.

NOTE

Limit operating pressure to 100 bar for minimum deflection. For strokes in excess of 600mm, see "Stop tube selection" on page NO TAG.

With unsupported loads, the bearing must absorb more force. For these applications, the larger available rod is recommended, and stop tubes should be considered.

Use high tensile socket head cap screws or hex head bolts tightened to the manufacturer's recommended torque.

For severe side load applications, consult your local Vickers by Danfoss sales engineer.

TV07 Head Rectangular Mounts (DIN ME5)

These mounts are ideal for straight line force transfer applications in which the cylinder is used in tension (pulling).

The mounting surface should be flat, and the rod end cartridge should be piloted into it.

The frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.

NOTE

For strokes in excess of 600mm, see "Stop tube selection" on page NO TAG.

The force of the load should be perpendicular to the mounting surface

and parallel to the centerline of the piston rod. For eccentric loads, the larger of the two available rods in each bore size is recommended. Stop tubes should also be considered.

The head rectangular mounts (TV07 and TV09) are recommended for heavy duty applications.

Use high tensile socket head cap screws or hex head bolts tightened to the manufacturer's recommended torque.

TV09 Head Rectangular Mounts (ISO ME5)

These mounts are ideal for straight line force transfer applications in which the cylinder is used in tension (pulling).

The mounting surface should be flat, and the rod end cartridge should be piloted into it.

The frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.

NOTE

For strokes in excess of 600mm, see "Stop tube selection" on page NO TAG.

The force of the load should be perpendicular to the mounting surface

and parallel to the centerline of the piston rod. For eccentric loads, the larger of the two available rods in each bore size is recommended. Stop tubes should also be considered.

The head rectangular mounts (TV07 and TV09) are recommended for heavy duty applications.

Use high tensile socket head cap screws or hex head bolts tightened to the manufacturer's recommended torque.

TV10 Clevis Mount (ISO MP1)

These mounts can be used both in compression (push) and tension (pull). Care must be exercised to prevent rod buckling in compression applications with long strokes. See page NO TAG for stroke limitations.

NOTE

For strokes in excess of 500mm, see "Stop tube selection" on page NO TAG.

The centerline of the machine member that attaches to the swivel pin must be perpendicular to the centerline of the piston rod and the curved path must be in one plane only. Any misalignment will cause excess side loading on the bearing and piston. This will lead to premature failure. For applications with small amounts of misalignment, consider the spherical bearing mount, TV11.

These mounts are for applications in which the machine member travels in a curved path within one plane.

TV11 Spherical Bearing Mount

(ISO MP5)

This mount is for applications in which the machine member travels in a curved path in one plane where some misalignment is unavoidable. The amount of allowable misalignment can be calculated.

This mount can be used both in compression (push) and tension (pull) applications. Care must be exercised to prevent rod buckling in compression.

applications with long strokes. See page NO TAG for stroke limitations.

NOTE

For strokes in excess of 500mm, see "Stop tube selection" on page NO TAG.

Maximum radial static and dynamic bearing loads must not exceed the recommended ratings shown in the following table.

Angle Z is the recommended maximum angle of misalignment.

To find the maximum recommended X distance, multiply the distance between pivot mounting holes (see TV11 dimensional drawing) by the tangent of angle Z.

Bore Ø (mm)	Mounting Hole Ø (mm)	Static Radial Load Rating (kN)
25	12	8
32	16	12,5

TV14 Cap Rectangular Mounts (ISO ME6)

These mounts are for straight line force transfer applications in which the cylinder is used in compression (pushing) and tension (pulling) applications.

The mounting surface should be flat and perpendicular to the force of the load.

The frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.

The cap rectangular mount (TV14) is recommended for heavy duty applications.

NOTE

For strokes in excess of 600mm, see "Stop tube selection" on page NO TAG.

Use high tensile socket head cap screws or hex head bolts tightened to the manufacturer's recommended torque value.

TV15 Intermediate Trunnion Mount

(ISO MT4)

The Intermediate Trunnion Mount is for longer stroke applications in which the machine member travels in a curved path in one plane.

On special orders, the trunnion can be located anywhere along the body.

This mount can be used both in compression (push) and tension (pull) applications.

NOTE

For strokes in excess of 500mm, see "Stop tube selection" on page NO TAG.

It is recommended that rigidly mounted pillow blocks with bearings at least as long as the trunnion pins be used. The pillow blocks should be installed as close to the shoulder of the trunnion as possible.

* The standard XV dimension is Stroke/2 + XV (std.) unless otherwise specified.
+ Plus stroke

TV16 Cap Trunnion Mounts (ISO MT2)

These mounts are for applications in which the machine member travels in a curved path in one plane.

Either mount can be used both in compression (push) and tension (pull) applications. When used in compression applications, head trunnion mounts provide a longer maximum stroke than cap trunnion mounts.

NOTE

For strokes in excess of 500mm, see "Stop tube selection" on page NO TAG.

The trunnion pins are an integral part of the head and can be sleeved to provide

an extremely tight fit to the mating machine member and permit curvilinear motion.

It is recommended that rigidly mounted pillow blocks with bearings at least as long as the trunnion pins be used. The pillow blocks should be installed as close to the shoulder of the trunnion as possible.

TV17 Head Trunnion Mounts (ISO MT1)

These mounts are for applications in which the machine member travels in a curved path in one plane.

Either mount can be used both in compression (push) and tension (pull) applications. When used in compression applications, head trunnion mounts provide a longer maximum stroke than cap trunnion mounts.

NOTE

For strokes in excess of 500mm, see "Stop tube selection" on page NO TAG.

The trunnion pins are an integral part of the head and can be sleeved to provide

an extremely tight fit to the mating machine member and permit curvilinear motion.

It is recommended that rigidly mounted pillow blocks with bearings at least as long as the trunnion pins be used. The pillow blocks should be installed as close to the shoulder of the trunnion as possible.

TV21 Cap Extended Tie Rod Mounts (ISO MX2)

These mounts are for straight line force transfer applications. The cap extended tie rod mount is recommended for compression (pushing) applications.

The mounting surface should be flat and the frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.

Once fitted into the application framework, the nuts which are provided should be torqued to the values listed in the table (right).

NOTE

For strokes in excess of 600mm, see "Stop tube selection" on page NO TAG.

Tie Rod Diameters & Torque Values

Diameters and torque values in the following table apply to all mounting styles.

Bore Ø (mm)	Tie Rods Ø (mm)	Torque* (Nm)
25	5	5,5
32	6	11
40	8	19
50	12	45
63	12	68
80	16	140
100	16	205
125	22	460
160	27	935
200	30	1520

* Recommended torque values using MoS₂ lubricant with 0,12 coefficient of friction.

TV22 Head Extended Tie Rod Mounts (ISO MX3)

These mounts are for straight line force transfer applications. The head extended

tie rod mount is recommended for tension (pulling) applications.

The mounting surface should be flat and the frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.

On head mount applications, the cartridge provides a pilot diameter to align the rod in the mounting frame.

Once fitted into the application framework, the nuts which are provided should be torqued to the values listed in the table on the previous page.

NOTE

For strokes in excess of 600mm, see "Stop tube selection" on page NO TAG.

The force on the rod should be perpendicular to the mounting surface and coincide with the centerline of the piston rod. For eccentric loads, the larger of the two available rods in each bore size is recommended. Stop tubes should also be considered.

TV23 Both Ends Extended Tie Rod Mounts (ISO MX1)

These mounts are for straight line force transfer applications. Both ends

extended tie rod mounts are suited for tension and compression applications or applications where additional hardware is to be attached to cylinders.

The mounting surface should be flat and the frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.

Once fitted into the application framework, the nuts which are provided should be torqued to the values listed in the table on page 19.

NOTE

For strokes in excess of 600mm, see "Stop tube selection" on page NO TAG.

The force on the rod should be perpendicular to the mounting surface and coincide with the centerline of the piston rod. For eccentric loads, the larger of the two available rods in each bore size is recommended. Stop tubes should also be considered.

TV25 Double Rod End, Side Lug Mounts (ISO MX1)

Double rod cylinders are specified when equal displacement is desired on both sides of the piston, or when the application is such that another function can be performed simultaneously with a second rod.

The single rod mount application data is also applicable to double rod cylinders.

NOTE

Limit operating pressure to 100 bar for minimum deflection.

++ Plus 2x Stroke

TV47 Cap Fixed Eye Mount (ISO MP3)

These mounts are for applications in which the machine member travels in a curved path within one plane.

These mounts can be used both in compression (push) and tension (pull). Care must be exercised to prevent rod buckling in compression applications with long strokes. See page 41 for stroke limitations.

NOTE

For strokes in excess of 500mm, see "Stop tube selection" on page NO TAG.

Common Options Section

Rod End Types

In addition to selecting the correct bore, you must specify the appropriate rod size and rod end configuration for your application.

Five different rod end configurations are available. If a custom design is

required, contact your local Vickers by Danfoss sales engineer, and define your requirements.

The table on page NO TAG gives maximum allowable push strokes at various operating pressures for

available rod diameters of Series TV cylinders. Rod ends on rigid mount cylinders should be supported. Longer strokes are allowable for **pull only** applications. Contact your local Vickers by Danfoss sales engineer for application assistance if necessary.

See pages 9 through 23 for **C** dimensions.

Port Type and Size

Available Ports

Series TV cylinders are available with SAE straight thread O-ring ports and the alternate ports listed below.

The table below lists the port types and sizes available for each bore diameter. The table on page NO TAG lists the maximum piston velocities obtainable with each bore diameter and port type combination.

Some mounting styles have location restrictions. Where a port or port boss interferes with cylinder mounting, mounting takes precedence. See page 5 for a table of port location availability.

^A - Size per ANSI B93.75M.

^D - Conforms to DIN 24554.

Port Location

Port locations are identified by viewing the cylinder from the head end (or from the mounting end of double rod cylinders). The location numbers are shown below.

Certain port locations cannot be specified with some mounting styles. The table below indicates which of the head and cap port locations are available for each Series TV mounting style.

Mounting Style Code	Description	Head Locations				Cap Locations

A – Available

N – Not available

W – Port available without port boss only.

Proximity switch not available. (Port codes 3, 5, 7, and 9)

Sealing Systems

Three different sealing systems are available in Series TV cylinders.

Determine the correct seal code for your application, then enter it as item 8 in the model code.

Code	Fluid	Temperature (°C)	Max. Speed (m/s)	Application
N	Mineral oil, petroleum base Automotive transmission fluid	–35 to 80	0,7	Normal, typical industrial
L	Mineral oil	–35 to 120	5	Low friction servo
	Water glycol (HFC)	10 to 70	1	Fire retardant fluids
	Oil-in-water emulsions (HFA)			
	Water-in-oil emulsions (HFB)			
T	Mineral oil	–25 to 200	5	High temperature
	Phosphate esters, petroleum oil blends	0 to 200	5	Fire retardant fluids
	Fyrquel 220, 550, 1000			
	Hought-O-Safe 1340			
	Pydraul 200, 230C, 280, 312C, 540C, A200			

Gland Drain Option

Gland drains are primarily used for long stroke cylinders (over 1 m) and when extended speed exceeds retract speed.

The gland drain is used to return any accumulated fluid, between the rod seal and wiper, to tank. This is used in servo applications, for ultra-low leakage requirements, or for remote visual monitoring of rod seal leakage for preventive maintenance purposes.

Air Bleed Option

Usually cylinders will bleed themselves of air when ports are vertical, on top. Bleed ports are often desirable to remove entrapped air, when the ports are on the bottom. High performance and high speed or heavy load applications are a few examples where air bleeds are desirable.

PS 200 Proximity Switches

PS 200 proximity switches for Series TV cylinders are inductive type switches with a sensing probe that “looks” at the cushion collar or button to provide full extend or full retract indication. Since the probe is inside the cylinder, harsh external environments don’t affect sensing. The 2-wire circuit will operate on AC or DC and works as reliably as a programmable controller. PS 200 switches meet UL requirements for 210

bar hydraulic cylinders. Vickers by Danfoss switch adaptor allows full 360° rotation. Short Circuit Protection is a standard feature on the PS 200 Proximity Switch. SCP protects the switch from shorts in the load or line. Upon sensing a short condition, the switch assumes a non-conducting mode. The fault condition must be removed and power turned off in order to reset the switch.

This feature prevents unintended automatic restarts. The switch indicates when it is in SCP mode by flashing both LEDs.

Torque 1/4–20 mounting screws to 20 Nm (15 ft-lb).

O-rings required:
Size 115 – One per switch
Size 116 – One per spacer

Series PS 200 2-wire AC/DC Proximity Switches	
Pressure	210 bar
Sensing range	2,0 mm ±10%
Operating temperature range	–20° to +70°C
Repeatability	0,025 mm
Switching differential	10%
Supply voltage	20–220 V AC/DC
On-State voltage drop	10V @ 5–500 mA
Load current man.	0,5 Amp
Inrush current	3 Amp
Quiescent current	1,7 mA max.
Indicating LED's (standard)	1 lit: Power on non-conducting 2 lit: Target present (both flashing = SCP mode)

With the Vickers by Danfoss switch adaptor, the proximity switch can rotate 360°. Use the chart on previous page for available proximity switch locations for the various mounting styles.

Application / Engineering Data

Stop Tube Selection

The following table lists the maximum stroke permissible without the use of a stop tube. Strokes are listed for rigid mounting styles as well as clevis and trunnion pivot mounts.

As the stroke length of a cylinder increases, the resultant bearing loads on the piston rod become greater. To keep these bearing loads from exceeding design limitations, and to obtain optimum life from a cylinder, stop tubes should be specified according to the following procedure:

To order a stop tube, enter XXX for model code item 8. Then specify the cylinder's working stroke and the required stop tube length. Specify 25 mm of stop tube for each 250 mm (or fraction thereof) of stroke in excess of the maximums listed in the table.

Bore Ø (mm)	Maximum Stroke (mm)		
	Pivot Mounts	Rigid mounts	
		Unsupported Rod	Supported Rod
25	500	600	1000
32	500	600	1000
40	600	750	1200
50	600	750	1200
63	750	965	1200
80	750	965	1200
100	750	965	1200
125	900	1000	1200
160	900	1000	1200
200	900	1000	1200

Stop Tube Designs

Three typical stop tube designs are illustrated below.

Design A

Used for cylinders not cushioned on the rod end.

Design B

Used for cushioned hydraulic cylinders.

Design C

The best choice for a cylinder with an exceptionally long stop tube requirement. Note that the piston's effective bearing area is doubled, in addition to gaining the normal increased

minimum distance between bearing points.

Tie Rod Spacers and Center Supports

A tie rod spacer or center support should be applied when the stroke length exceeds 20 times the bore diameter.

Tie rod spacer

Tie rod spacers and center supports are used to improve the structural rigidity of long stroke tie rod cylinders.

The spacers have through holes for the tie rods and are held in place on the cylinder barrel with a small tack weld or set screw.

The spacer keeps the tie rod in the proper position around the centerline of the cylinder and acts much like a truss in preventing excessive deflection in a long stroke cylinder that is not rigidly mounted (clevis mount, etc.).

Through tie rods

Tie rod center support

The center support has side mounting lugs similar to side lug mount heads and serves as an additional mounting location. The tie rods are threaded into the center support and it becomes a load-carrying component of the cylinder assembly.

The exact location of the tie rod center support is generally optional, which greatly increases the flexibility in mounting a long stroke cylinder.

Tapped tie rods

Mounting lug similar to Style TV01

Bore & Rod Diameters

Cylinder Size Selection

To choose the proper size of cylinder for your application, first determine the maximum push and/or pull force required to do the job. Then use the table below to select the cylinder that will provide that force. Remember that force capabilities derived from charts

and formulas may be theoretically correct, but other factors must be considered. Be sure to allow for pressure drop between the pump outlet and the cylinder port. Also, some of a cylinder's force is used up overcoming seal friction and, to a lesser extent, the inertia of the piston itself. In Vickers by Danfoss cylinders, the amount of extra force needed to compensate for these factors has been limited to 5% or less of the

cylinder's theoretical power—without sacrificing sealing performance.

For maximum reliability and fatigue life of the piston rod, the largest rod offered in a given bore size should be specified. The smaller rods for a given bore are primarily intended for short stroke push loading or reduced pressure applications.

Bore Ø (mm)	Rod Ø (mm)	Work Area (cm ²)	Maximum Force (kN) At Working Pressure (bar)

Maximum Allowable Push Strokes

In push applications, a cylinder acts as a loaded column. There are two basic ways to measure the column length.

Pivot mounts:

The length is measured from the pivot point to the end of the rod in the fully extended position.

Flange and other rigid mounts:

The exposed piston rod is considered to be the column length with a fixed end at the cylinder which allows longer strokes.

To use the table below, first go to the section for your mounting style. Then locate the column which is closest to, but not below, your application's operating pressure. The intersection of

operating pressure and bore/rod size represents the maximum allowable push stroke. This maximum stroke is based on column loading analysis only and does not consider side loading, stop tube requirements or other cylinder stroke limiters.

For pressures above 210 bar, consult your local Vickers by Danfoss representative.

		Maximum Stroke (mm) at Working Pressure (bar)																	
BORE ROD		Rigid Mounts (01, 04, 07, 09, 14, 21, 22, 23, 25, 33, 39, 40, and 47)						Cap Swivel Mounts (10, 11, and 16)						Trunnion Mounts (15, 17, 34, and 35)

Cushioning System

Vickers by Danfoss cylinders have standard features that are extra cost options or not available on other look-alike

ISO/DIN cylinders. Series TV hydraulic cylinders are available with a patented floating ring cushion seal or alternate solid design with check valve that provide positive cushion sealing with minimum wear and maximum piston acceleration on the return stroke.

Advanced Cushions Provide Faster Cycle Times

Cylinder cushions are designed to decelerate the piston velocity near the end of each cylinder stroke to prevent excessive mechanical shock.

To accomplish this, the cushion collar contacts a floating sleeve or cylinder head which permits a very close seal contact without high loading. The sleeve seats against the head and provides a very effective seal to trap the fluid. Consistent performance and long life are provided.

Vickers by Danfoss advanced cushions permit higher cylinder speed, shorter cycle time, and more work per hour.

The sleeve design is also free to move in an axial direction and functions as a fluid check. When the fluid flow is reversed, the sleeve moves off its seat, and fluid flows around the slots in the outer sleeve's diameter permitting nearly full flow for quick acceleration.

Cushion Features

- Cushion design provides consistent long wearing seal between cushion collar and head.
- Floating design self-aligns to minimize wear.
- Check valve action of sleeve provides rapid acceleration out of the cushion.

Cushions are recommended when piston speed exceeds 0,13 m/s. Any heavy loads attached to the piston rod should be absorbed by external means such as shock absorbers or springs.

Application Data

Cushioning System

Key Assumptions & Limitations

These assumptions provide parameters for determining maximum cushion performance. Actual performance may be different than determined by these methods, particularly if assumptions are not maintained.

Efficiency factors are applied to the energy calculations that attempt to reflect characteristics of the Vickers by Danfoss cushion design.

The following assumptions should be considered when calculating cushion capacity:

- Maximum cushion pressure is 310 bar (4500 psi).
- The upper limit of velocity is 0.5 m/s.
- If velocity is below 0,13 m/s, the cushions become ineffective on cylinders smaller than 80 mm bore.
- Friction force is assumed to be zero.
- The cylinder is used in a linear system (not for rotary applications).
- Fluid viscosity is equivalent to 25 centistoke.
- The driving pressure is equal to the maximum system pressure, usually the relief valve setting.
- Cushion adjustment screws are provided to tune cushion performance within limits.
- Cushion efficiency (C_{eff}) is 0.67 for velocities between 0,1 and 0,3 m/s., or 0,5 for velocities between 0,3 and 0,5 m/s.

Application 1

Application 2

Application 3

Application 1:

$$E = [0,5 M V^2] \text{ extend or retract}$$

Application 2:

$$E = (1/C_{eff}) \{ [0,5 M V^2] - [9,81 M (L_{hc}/1000 \sin(\alpha))] \} \text{ extend}$$

$$E = (1/C_{eff}) \{ [0,5 M V^2] + [9,81 M (L_{cc}/1000 \sin(\alpha))] \} \text{ retract}$$

Application 3:

$$E = (1/C_{eff}) \{ [0,5 M V^2] + [9,81 M (L_{hc}/1000 \sin(\alpha))] \} \text{ extend}$$

$$E = (1/C_{eff}) \{ [0,5 M V^2] - [9,81 M (L_{cc}/1000 \sin(\alpha))] \} \text{ retract}$$

Calculations for TV Cylinder

Units (US)

E	Energy	joule
M	Mass	kg
V	Velocity	m/s
P _d	Driving pressure	bar
L _H	Head cushion length	mm
L _C	Cap cushion length	mm
g	Gravity constant	9,81/1000

Example

TV cylinder in application 3 and extending:

Using a TV cylinder with a 100 mm bore, 45 mm rod is mounted at a 45° angle from horizontal with rod down. A 1300 kg mass is attached to the rod and system pressure is 100 bar. The cylinder is moving the mass at 0,3 m/s.

Using the calculation for application 3:

$$E = (1/C_{eff}) \{ [0,5 M V^2] + [9,81 M (L_{hc}/1000 \sin(\alpha))] \}$$

$$E = (1/0.67) \{ [0,5 * 1300 * 0,3^2] + [9,81 * 1300 * (33/1000) * \sin(45)] \}$$

$$E = 531 \text{ newton-m (joule)}$$

Pick the chart (see page 46) for TV cylinder, rod extending, and first rod. The curve is for the 100/45 bore/rod. Enter the vertical axis at 531 newton-m and the horizontal axis at 100 bar. The point of intersection is below the 100/45 curve so the cushion is acceptable. The maximum allowable pressure on the cap end is 160 bar which is greater than the specified system pressure of 100 bar.

Weights

The following table lists approximate net weights of Series TV cylinders.

Weights shown are based on cylinders with standard rod diameter and single rod end. All weights are expressed in kilograms.

Double rod cylinder weight is equal to 1,15 times chart weight plus weight due to stroke.

Approximate Cylinder Weights

Bore Ø (mm)	Rod Ø (mm)	Zero Length Weight (kg)				Single Rod Weight per mm of Stroke (kg)	Double Rod Weight per mm of Stroke (kg)
